HW 5

November 22, 2020

- 1. (Problem 7.6 in textbook) Consider the trapezium and Simpson's rule applied to $\int_0^1 (x^5 Cx^4) dx$.
 - Write down the error for trapezium and Simpson's rule, as functions of C.
 - Find C that makes the error under trapezium rule is 0.
 - ullet Find the range of C where the trapezium rule is more accurate than Simpson's rule.
- 2. (Problem 7.11 in textbook) Suppose $f \in C^4([-1,1])$. Let p be the Hermite interpolation polynomial of f at $x_0 = -1$, $x_1 = 1$.
 - Calculate $\int_{-1}^{1} p dx$ and write it as a linear combination of $f(\pm 1)$, $f'(\pm 1)$.
 - Prove that

$$\left| \int_{-1}^{1} f dx - \int_{-1}^{1} p dx \right| \le \frac{2}{45} \max_{c \in [-1,1]} |f^{(4)}(c)|$$

3. (Problem 10.3 in textbook) Show that if $f \in C^2([0,1])$, then there is some point $c \in (0,1)$ such that

$$\int_0^1 x f dx = \frac{1}{2} f(2/3) + \frac{1}{72} f''(c)$$

Hint: use Gauss quadrature with weight x.

4.

• Suppose f is continuous on [0,1]. Let I_n be the estimate of $\int_0^1 f dx$ using composite trapezium rule with n subintervals. Show that

$$\lim_{n \to \infty} \left| \int_0^1 f dx - I_n \right| = 0$$

Hint: There are many possible approaches. You can use the fact that any continuous function on a closed interval is uniformly continuous (for any $\epsilon > 0$, there is some δ such that $|x-y| < \delta$ implies $|f(x)-f(y)| < \epsilon$), or use the Weierstrass approximation theorem.

• (Optional) Find a continuous function f, such that there is C > 0 such that

$$\left| \int_0^1 f dx - I_n \right| \ge \frac{C}{n}$$

Hint: if f has bounded second derivative then the error decays like $O(1/n^2)$, so you need to find some f that doesn't have second order derivative or has unbounded second order derivative.
